

Senior Software Engineer

FULL-STACK SYSTEMS & INTERACTIVE EXPERIENCES

Department: Engineering & Product Development

Position Type: Full-Time

Experience Level: Senior (7-10+ Years)

Location: Hybrid / Remote Available

POSITION SUMMARY

We are seeking a highly versatile, solution-oriented Senior Software Engineer to lead the design, architecture, and optimization of our next-generation software platforms and interactive applications. This unique role requires a cross-functional engineer capable of bridging high-performance backend systems, interactive frontend layers, and complex optimization structures.

The ideal candidate brings a blend of robust software architecture principles, test-driven methodologies, and deep technical expertise in performance tuning—whether optimizing web services rendering pipelines or handling data-intensive application flows. You will collaborate closely with product managers, designers, data scientists, and cross-functional engineering teams to translate complex creative concepts into stable, scalable, and highly performant product releases.

Key Focus: Combines core software engineering architecture, agile project leadership, and meticulous system performance optimization across web and interactive platforms.

CORE RESPONSIBILITIES

- **System Architecture & Development:** Oversee, maintain, and build core software architectures, web services, and interactive components. Lead both front-end and back-end integration to deliver flawless multi-platform experiences.
- **Performance Optimization & Tuning:** Identify and eliminate bottlenecks. Optimize rendering pipelines, framework performance, and system resources to drastically enhance frame rates, user interaction quality, and page load speeds.
- **Agile Leadership & Scrum:** Champion agile software development cycles. Act as a mentor or Scrum Master when needed, contributing heavily to feature planning, sprint estimation, interactive prototyping, and milestone deployments.
- **Quality Assurance & Testing:** Implement and maintain rigorous development workflows, emphasizing Version Control/Source Control best practices, Test-Driven Development (TDD), automated debugging, and continuous integration to safeguard live deployment stability.
- **Cross-Functional Collaboration:** Translate ambitious UI/UX concepts and creative mockups into stable mechanics. Coordinate smoothly with digital asset designers, artists, and business analytics stakeholders.

- **Client & Documentation Excellence:** Author comprehensive technical documentation and process guides to preserve business continuity. Conduct clean, live technical demonstrations to stakeholders and customers, actively nurturing client relationships.

REQUIRED TECHNICAL SKILL TREE

- **Engineering & Architecture:** Full-stack web and systems engineering, comprehensive code structuring, object-oriented/modular design, and data pipeline management.
- **Optimization Frameworks:** Advanced performance tuning, 3D/rendering pipeline optimization, web performance optimization, asset integration, and memory footprint management.
- **Methodologies:** Test-Driven Development (TDD), Agile/Scrum leadership, continuous profiling, and rigorous code reviews.
- **Tools & Systems:** Advanced enterprise Source/Version Control systems, interactive debugging tools, and agile product track management platforms.

EDUCATION & EXPERIENCE REQUIREMENTS

- **Professional Experience:** Minimum of 7–10 years of proven hands-on software development experience, ideally spanning senior technical roles across web infrastructure or high-performance interactive/game systems environments.
- **Educational Background:** Bachelor's or Master's degree in Computer Science, Software Engineering, Data Science, or a closely related technical discipline.
- **Localization & Communication:** Native or professional fluency in English is required; multilingual capabilities (e.g., French or Spanish) are highly regarded for international localization initiatives.
